FIELD VALIDATION REPORT

BuilderWrx Field Visit: Keiper Basement Retrofit

Bespoke Contracting · Needham, MA

Date: April 6, 2026

Conducted by: Jessica Mitchell & Isaac Mitchell

Interviewees: Kevin (Project Manager), Travis (Site Superintendent)

Duration: ~2 hours (on-site interview + job site walkthrough + live Kestrel testing)

Prepared by: White Lane AI / BuilderWrx

Executive Summary

On April 6, 2026, Jessica and Isaac Mitchell conducted a two-hour on-site field visit at Bespoke Contracting's Keiper basement retrofit project in Needham, MA. The visit included structured interviews with **Kevin** (Project Manager) and **Travis** (Site Superintendent), a live walkthrough of the job site, hands-on testing of the Kestrel field app, and demonstration of four BuilderWrx prototype screens.

Both users independently described features that map directly to BuilderWrx's architecture—the AI intake system, the living scope document, and cross-project knowledge compounding—**before being told these features exist.**

Core Finding: BuilderWrx's thesis is validated. The primary concern is trust—AI-generated data must pass through human review before being committed or shared with clients.

1. Visit Context

Project	Keiper Basement Retrofit — full remodel (gym, wine cellar, bar, bathrooms, mechanical room)
Contract Type	Fixed price (unusual for Bespoke—most jobs are cost-plus)
Phase	Framing day one; lumber delivery arriving; HVAC starting next week
Plans	6-page construction document set, evolving as designers add detail
Demos Shown	Selection Tracker, Scope Tree, Command Center, Gantt Chart, Kestrel Field App

2. Current Workflow Analysis

2.1 The Proposal & Estimation Process

```
Construction Plans
   ↓
Sent to Subs & Vendors for Bids
   ↓
Bids Return (labor + materials, varying formats)
   ↓
PM Combines into Master Proposal
   ↓
Entered into BillBook for Client Presentation
   ↓
Homeowner Reviews → Value Engineering
   ↓
Revised Bids → Updated Proposal → Final Agreement
```

Key finding: During the visit, a significant discrepancy was discovered between BillBook's client-facing numbers and the PM's detailed spreadsheet. AV allowance showed ~$12K in BillBook vs. ~$21K in the spreadsheet; AV home network showed ~$3,500 vs. ~$37K. This is exactly the data integrity problem BuilderWrx's single-source-of-truth architecture eliminates.

2.2 The Master Selections Tracker (MST)

The MST is a ~500-line spreadsheet serving as the central record for every selection on a project:

- **Template-based:** Every bathroom has the same items (toilet, vanity, sink, fixtures, tile, paint). Scott builds the template; Kevin customizes per project.
- **Fully manual:** Kevin enters every selection by hand as information arrives from designers, homeowners, and vendors.
- **Multi-format inputs:** Selections arrive via email, PDF spec packages, spreadsheets, Google Drive, Dropbox, and phone calls.
- **Time-intensive:** A large project would require "thousands of lines."
- **Reusable but rigid:** Template works across jobs but must be manually expanded per project.

2.3 The Responsibility Matrix

A separate document tracking four responsibility chains for every selection:

1. **Who specifies** (designer, homeowner, architect)
2. **Who purchases** (Bespoke, designer, homeowner)
3. **Who schedules** (PM, sub, vendor)
4. **Who installs** (Bespoke crew, subcontractor)

Any party can own any step. Example: the flooring designer handles specification, purchasing, and scheduling through her own carpet company—Bespoke only installs.

2.4 How Their Day Breaks Down

ACTIVITY	KEVIN (PM)	TRAVIS (SITE SUPER)
Problem solving / fire-fighting	~60%	~20%
Answering questions / coordinating	~15%	~50%
Data entry / file management	~25%	~0%
Planning ahead (materials, scheduling)	Included in above	~30%

> **Kevin:** *"Days when I could sit in front of the computer and just do data entry I feel like are very productive days. But most of my day is problem solving—just putting out fires."*

> **Travis:** *"A lot of mine is just info faster. I'm either going to Kevin or going to the designer or going to six other people to get the info that I don't have."*

3. Feature Validation Matrix

FEATURE	KEVIN (PM)	TRAVIS (SITE SUPER)	SIGNAL
Selection Tracker	Needs clear navigation + spec links	Wants specs without pricing	Validated
Living Scope Tree	"100% yes"—click room, see all info	"If I knew the vanity size while framing, I'd frame differently"	Strongly Validated
Command Center	Understood immediately	Wants field-appropriate view	Validated
Gantt Chart	Uses Gantt "very often"	"How does moving this affect timeline?"	Validated
Kestrel Field App	"An assistant following you around"	Engaged naturally with photos + voice	Validated in Field
AI Intake (Rosetta)	Described independently before being told	N/A	Organically Validated
Building Code Reference	Both described need unprompted	"Save three hours with the plumber"	Unexpected Discovery
Knowledge Compounding	Understood immediately	Described pocket door example unprompted	Organically Validated

Features NOT Demonstrated but Requested

FEATURE	REQUESTED BY	PRIORITY
Automatic spec sheet lookup by model number	Kevin + Travis	HIGH

FEATURE	REQUESTED BY	PRIORITY
Building code reference (IRC + MA amendments)	Travis + Kevin	HIGH
Plan version management (swap individual pages)	Kevin + Travis	HIGH
PM approval workflow for receipts	Kevin	HIGH
Proactive prompting ("did you check makeup air?")	Kevin + Travis	HIGH
Temp vs. permanent tracking	Travis	MEDIUM
LiDAR scan integration	Kevin	LOW
Revit model integration	Kevin	LOW

4. Validated Feature Roadmap

TIER 1 — THIS WEEK

Must Have for Return Visit

1. **Selection Tracker v2** — Clear navigation (Command Center → Project → Selections), spec sheet links, color-coded room completeness, field view without pricing
2. **Intake System (Rosetta) MVP** — Project-specific email, AI extraction from PDFs/spreadsheets/emails, confirmation prompts, auto spec lookup by model number
3. **Scope Tree / Living Scope Doc** — Room-based navigation, shows existing info AND what's missing, responsibility matrix integration

TIER 2 — WEEKS 2–4

Near-Term

4. **Gantt Chart v2** — AI-generated preliminary schedule, what-if modeling, PM approval gate, daily task list for site super
5. **Daily Log Automation** — Auto-generated from Kestrel activity, PM review before sharing, sensitive content flagging
6. **Receipt & Approval Workflow** — Photo receipt → AI extract → PM approval → office AP

TIER 3 — MONTHS 1–2

Medium-Term

7. **Building Code Reference Engine** — IRC 2021 + MA amendments, manufacturer clearances, proactive prompting, per-town inspection tracking
8. **Plan Version Management** — Track revisions, swap individual pages, flag changes, always serve current plans
9. **Knowledge Compounding System** — Lessons per project/trade/town, installation notes, surfaces on future projects

TIER 4 — FUTURE VISION

Long-Term

10. 3D / LiDAR integration — Virtual space navigation with room-linked data
11. Revit model import — Designer models as navigable field reference
12. AI pen integration — Handwritten notes digitized into system
13. Bluetooth voice device — Push-to-talk field capture

5. Persona Profiles

PROJECT MANAGER

Kevin

Device	Laptop (office), iPhone (field)
On-site	1–2x per week
Tools	OneNote, BillBook, Dropbox, Spreadsheets
Pain	Manual data entry across siloed systems
Dream	"Dump everything in, AI organizes it"

> *"Tell me the things you don't know, so I can tell you what that is."*

SITE SUPERINTENDENT

Travis

Device	iPhone (daily), prefers iPad
On-site	Daily, all day
Tools	Phone notes, Dropbox, printed plans
Pain	Getting info fast (specs, clearances)
Dream	"Pull up room, see everything, AI flags gaps"

> *"A lot of mine is just info faster."*

The Handoff Between Them

Kevin pre-processes information for Travis. Travis flags field issues back to Kevin. BuilderWrx should serve as the **shared brain** between these two roles—Kevin populates from the office side, Travis consumes from the field side, and both contribute through their respective interfaces.

6. Competitive Intelligence

Current Stack Being Replaced

TOOL	FUNCTION	PAIN
BillBook	Proposals, client-facing budgets	Medium — works but data doesn't match internal records
Dropbox	File storage, plan sharing	High — manual organization, access issues
Excel/Sheets	MST, responsibility matrix, checklists	Very High — 500+ lines, fully manual
OneNote	PM personal task management	Low — Kevin likes it, but siloed
QuickBooks	Accounting, AP	Medium — office-only, no field visibility
Email	Primary intake channel	Very High — unstructured, multi-format

What No Competitor Does

1. AI intake from email/PDF → auto-populated selection tracker
2. Building code reference integrated into project context
3. Knowledge compounding across projects
4. Site super instant spec access in room context
5. Proactive prompting based on daily schedule + fixture specs

These are not incremental improvements. They represent a fundamentally different product category.

7. Risk & Mitigation

RISK	SEVERITY	MITIGATION
AI commits wrong data	HIGH	Confirmation prompts, PM approval gate, audit trail
Email parsing mixes up projects	MED	Project-specific email addresses, vendor-project mapping
Field crew won't adopt	MED	Phone-first design, voice input, minimal manual entry
Auto-notifications alarm homeowner	HIGH	PM must approve ALL client-facing outputs
Subs won't change behavior	MED	PM forwarding as bridge; don't require sub adoption

8. Recommended Next Steps

TIMEFRAME	ACTION
This Week	Refine Selection Tracker with navigation, spec links, and color-coded completeness
This Week	Build Intake (Rosetta) MVP — project email + AI extraction with confirmation prompts
This Week	Return to Keiper site with updated prototypes
This Month	Ingest Bespoke's completed project files (Hargrove, Wierusz Kibarker)
This Month	Build code reference prototype (IRC 2021 + MA amendments)
This Month	Deploy Kestrel with daily log automation for Travis
This Quarter	Launch Phase 1A with Bespoke
This Quarter	Validate with second customer

Appendix: Selected Direct Quotes

> **Kevin on the intake vision:**
> *"I just want a repository of places where I can load whatever I need. And then the AI is working in the background to extract the information and put it into here. No one has to manually put these things in."*

> **Kevin on trust:**
> *"Tell me the things you don't know. So I can tell you what that is. I sometimes worry—it's much smarter than me, but is it going to make a mistake and put something somewhere that it thinks is accurate?"*

> **Kevin on file management:**
> *"If I never have to store another file, I'd be happy."*

> **Travis on speed:**
> *"A lot of mine is just info faster. I'm either going to Kevin or going to the designer or going to six other people to get the info that I don't have."*

> **Travis on knowledge compounding:**
> *"If we did pocket doors and put our notes in the app, on the next project the PM could see it and say, 'Hey, for these cabinetry sliders, we had to do this.' Instead of us reminding them."*

> **Travis on building codes:**
> *"If it told me this needed a certain clearance and this wall needed to move in a certain*

> *direction—things that you're just not always thinking about. If it hits a requirement, it'll tell me."*

> **Kevin on the future:**
> *"I'm gonna have so much time on my hands now."*
